## INTEGRAL DISTANCES

## NORMAN H, ANNING AND PAUL ERDÖS

In the present note we are going to prove the following result:
For any $n$ we can find $n$ points in the plane not all on a line such that their distances are all integral, but it is impossible to find infinitely many points with integral distances (not all on a line). ${ }^{1}$

Proof. Consider the circle of diameter $1, x^{2}+y^{2}=1 / 4$. Let $p_{1}, p_{2}, \cdots$ be the sequence of primes of the form $4 k+1$. It is well known that

$$
p_{i}^{2}=a_{i}^{2}+b_{i}^{2}, \quad a_{i} \neq 0, \quad b_{i} \neq 0,
$$

is solvable. Consider the point (on the circle $x^{2}+y^{2}=1 / 4$ ) whose distance from $(-1 / 2,0)$ is $b_{i} / p_{i}$. Denote this point by $\left(x_{i}, y_{i}\right)$. Consider the sequence of points $(-1 / 2,0),(1 / 2,0),\left(x_{i}, y_{i}\right), i=1,2, \cdots$. We shall show that any two distances are rational. Suppose this has been shown for all $i<j$. We then prove that the distance from $\left(x_{i}, y_{i}\right)$ to $\left(x_{i}, y_{i}\right)$ is rational. Consider the 4 concyclic points $(-1 / 2,0),(1 / 2,0)$, $\left(x_{i}, y_{i}\right),\left(x_{j}, y_{j}\right) ; 5$ distances are clearly rational, and then by Ptolemy's theorem the distance from $\left(x_{i}, y_{i}\right)$ to $\left(x_{i}, y_{j}\right)$ is also rational. This completes the proof. Thus of course by enlarging the radius of the circle we can obtain $n$ points with integral distances.

It is very likely that these points are dense in the circle $x^{2}+y^{2}=1 / 4$, but this we can not prove. It is easy to obtain a set which is dense on $x^{2}+y^{2}=1 / 4$ such that all the distances are rational. Consider the

[^0]point $x_{1}$ whose distance from ( $-1 / 2,0$ ) is $3 / 5$; the distance from $(0,1 / 2)$ is of course $4 / 5$. Denote $(-1 / 2,0)$ by $P_{1},(1 / 2,0)$ by $P_{2}$, and let $\alpha$ be the angle $P_{2} P_{1} X_{1}$. $\alpha$ is known to be an irrational multiple of $\pi$. Let $x_{i}$ be the point for which the angle $P_{1} P_{2} X_{i}$ equals $i \alpha$; the points $X_{i}$ are known to be dense on the circle $X^{2}+y^{2}=1 / 2$, and all distances between $x_{i}$ and $x_{i}$ are rational because if $\sin \alpha$ and $\cos \alpha$ are rational, clearly $\sin i \alpha$ and $\cos i \alpha$ are also rational.

To give another configuration of $n$ points with integral distances, let $m^{2}$ be an odd number with $d$ divisors, and put

$$
m^{2}=x_{i}^{2}-y_{i}^{2} .
$$

This equation has clearly $d$ solutions. Consider now the points

$$
(m, 0), \quad\left(0, y_{i}\right) \quad i=1,2, \cdots .
$$

It is immediate that all the distances are integral.
These configurations are all of very special nature. Several years ago Ulam asked whether it is possible to find a dense set in the plane such that all the distances are rational. We do not know the answer.

Now we prove that we cannot have infinitely many points $P_{1}, P_{2}, \cdots$ in the plane not all on a line with all the distances $P_{i} P_{i}$ being integral.

First we show that no line $L$ can contain infinitely many points $Q_{1}, Q_{2}, \cdots$. Let $P$ be a point not on $L, Q_{i}$ and $Q_{i}$ two points very far away from $P$ and very far from each other. Put $d\left(P Q_{i}\right)=a$, $d\left(Q_{i} Q_{i}\right)=b, d\left(P Q_{i}\right)=c .(d(A, B)$ denotes the distance from $A$ to $B$.

$$
\begin{equation*}
c \leqq a+b-1 \tag{1}
\end{equation*}
$$

Let $Q_{i} R$ be perpendicular to $P Q_{i}$. We have

$$
a<d(P R)+\left(d\left(Q_{i} R\right)\right)^{2} / d(P R), \quad b<d\left(Q_{j} R\right)+\left(d\left(Q_{i} R\right)\right)^{2} / d\left(Q_{j} R\right) .
$$

Thus from (1)

$$
\left(d\left(Q_{i} R\right)\right)^{2}\left(\frac{1}{d(P R)}+\frac{1}{d\left(Q_{j} R\right)}\right)>1
$$

which is clearly false for $a$ and $b$ sufficiently large. $\left(d\left(Q_{i} R\right)\right.$ is clearly less than the distance of $P$ from $L$.) This completes the proof.

There clearly exists a direction $P_{1} X$ such that in every angular neighborhood of $P_{1} X$ there are infinitely many $P_{i}$.

Let $P_{2}$ be a point not on the line $P_{1} X$.
Denote the angle $X P_{1} P_{2}$ by $\alpha, 0<\alpha<\pi$. Evidently the $P_{i}$ cannot form a bounded set. Let $Q$ be one of the $P_{i}$ sufficiently far away from
$P_{1}$, where the angle $Q P_{1} X$ equals $\in(\epsilon$ sufficiently small). Denote $d\left(P_{1}, P_{2}\right)=a, d\left(P_{1}, Q\right)=b, d\left(P_{2}, Q\right)=c$. We evidently have

$$
c^{2}=a^{2}+b^{2}-2 a b \cos (\alpha-\epsilon) .
$$

$a, b, c$ all are integers. From this we shall show that if $b$ and $c$ are sufficiently large, $\epsilon$ sufficiently small, then

$$
\begin{equation*}
c=b-a \cos \alpha . \tag{2}
\end{equation*}
$$

Put

$$
c=b-a \cos \alpha+\delta, \quad \delta>0 .
$$

Then

$$
\begin{aligned}
(b-a \cos \alpha+\delta)^{2}= & b^{2}-2 a b \cos \alpha+a^{2} \cos ^{2} \alpha+2 \delta(b-a \cos \alpha) \\
& +\delta^{2}>a^{2}+b^{2}-2 a b \cos (\alpha-\epsilon)
\end{aligned}
$$

if $b$ is sufficiently large and $\epsilon$ sufficiently small. Similarly we dispose of the case $\delta<0$. Thus (2) is proved.

From (2) we have

$$
a^{2}+b^{2}-2 a b \cos (\alpha-\xi)=b^{2}-2 a b \cos \alpha+a^{2} \cos ^{2} \alpha
$$

or

$$
\cos (\alpha-\epsilon)-\cos \alpha=\frac{a^{2} \sin ^{2} \alpha}{2 b} .
$$

Thus we clearly obtain

$$
\epsilon<c_{1} / b .
$$

Thus clearly all the points $Q_{i}$ have distance less than $c_{2}$ from the line $P_{1} X$. Let $Q_{1}, Q_{2}, Q_{3}$ be three such points not on a line, where $d\left(Q_{i} Q_{i}\right)$ are large. Let $Q_{1} Q_{3}$ be the largest side of the triangle $Q_{1} Q_{2} Q_{2}$. Let $Q_{2} R$ be perpendicular to $Q_{1} Q_{2}$. We have as before
also

$$
d\left(Q_{1} Q_{3}\right) \leqq d\left(\varrho_{1}, Q_{2}\right)+d\left(Q_{2} Q_{3}\right)-1 ;
$$

$$
d\left(Q_{1} Q_{z}\right)-d\left(Q_{1} R\right)<\epsilon, \quad d\left(Q_{2} Q_{3}\right)-d\left(Q_{3} R\right)<\epsilon
$$

an evident contradiction; this completes the proof.
By a similar argument we can show that we cannot have infinitely many points in $n$-dimensional space not all on a line, with all the distances being integral.
